We are all increasingly aware of the dangers of the legionella bacteria which, if present in the water supply can lead to a deadly outbreak of Legionnaires' Disease (Legionellosis) and, in addition to endangering life, can lead to the criminal prosecution of employers.

Our clients utilise the specialist services of the dedicated ECG Facilities Services team of water hygiene technicians who conduct full risk assessments on their behalf and thereafter test, service and maintain this most crucial plant and equipment.

Planned preventative maintenance is recommended by ECG Facilities Services for all water hygiene systems.

We believe this offers our clients the most effective means of ensuring their water systems are fully compliant with all regulations and of safeguarding the health and safety of employees and the public.

Incorporated in the above are routine activities such as

- Risk Assessments
- Cleaning & Chlorination
- Tank Painting & Relining
- Testing / Sampling
- Preventative Maintenance
